ABOUT ME

Full-stack developer with 4 years of experience in the .NET ecosystem and modern frontend frameworks. I focus on clean, maintainable code (CQRS, DDD) and database performance optimization for high-traffic systems. Passionate about technical precision, I have worked with small teams to deliver stable ERP solutions and complex API integrations. I am a continuous learner who enjoys researching and applying new technologies to enhance system efficiency and deliver innovative software solutions.

EDUCATION

FPT University (Bachelor's) 06/2019 - 12/2023

Information Technology

- Software Engineer

PTIT University (Master) 07/2025 - Now

Information Technology

- Information System

TECHNICAL SKILLS

Backend Development	.NET Core, ASP.NET Web API, C#, Entity Framework Core, Dapper, Clean Architecture, CQRS, DDD Pattern
Database & Optimization	SQL Server (Strong), MySQL, Stored Procedures Optimisation, Deadlock Resolution, Database Indexing & Tuning, Redis.
Frontend Development	Angular, JS, CSS, HTML
DevOps & Deployment	Docker, IIS, Nginx, Load Balancing, High Availability Architecture, Environment Configuration, Cross-Platform Deployment (Windows & Ubuntu), AWS
Tools & Integration	Docker, RabitMq, Git (CI/CD basics), Postman, PostgreSQL, MySQL, Redis,Visual Studio, Cursor AI

WORK EXPERIENCE

MobiFoneIT 05/2025 - Now

Backend Developer

Document Management System for the Ministry of Finance

Document Management System – Ministry of Finance

- **System Architecture:** Designed a multi-layer system using RESTful APIs, LINQ, Dapper, and stored procedures for scalable and maintainable data access.
- **High Availability & Load Balancing:** Deployed the system on parallel IIS servers with load balancing and implemented SQL Server read/write replication to ensure high availability, scalability, and optimized performance for concurrent users.
- **File Storage, Security & Deployment:** Built a dedicated file storage server with digital signature and automated PDF conversion, ensuring secure document handling and stable, maintainable on-premise infrastructure.
- **Deployment & Scalability:** Deployed development environment on IIS and production via Nginx reverse proxy; configured parallel IIS servers for load distribution and implemented a two-node SQL Server Always On Availability Group (AAG) to ensure high availability, fault tolerance, and horizontal scalability.

AgileTech 1/2024 - 05/2025

Backend Developer

- **Technical:** Defined coding standards based on Clean Architecture, DDD, and ORM best practices to reduce bugs and technical debt, improve code quality, enforce SOLID principles, standardize project structure, and enhance maintainability, scalability, and consistency across systems.
- **System Development:** Developed and deployed an ERP application using .NET 9 and Angular, implementing the CQRS architecture and modern DevOps practices.
- **Real-time & Distributed Messaging:** Integrated Redis, RabbitMQ, and SignalR to enable real-time communication and distributed messaging.
  + Designed and implemented Redis-based authentication to manage access tokens and prevent unauthorized logins across multiple devices.
  + Utilized RabbitMQ and SignalR to process background jobs and push real-time notifications to users.
- **Performance Optimization:** Optimized system performance with LINQ, stored procedures, and Quartz for background job scheduling.
- **Deployment & Scalability:** Integrated AWS S3 for file storage and deployed the application on both Windows (IIS) and Ubuntu (Docker/Docker Compose), ensuring flexible, consistent, and highly available environments.

HopLongTech 08/2022 - 12/2023

Fullstack Developer

- **ERP System:** Managed the development and maintenance of a full-scale ERP application covering core business modules (Finance, Supply Chain, Inventory, HR, CRM).
  + Applied Dapper and LINQ for efficient data access and manipulation, resulting in optimized database queries and improved throughput.
  + Database Optimization: Handled complex data scenarios involving large tables. Successfully resolved critical database deadlocks and optimized Stored Procedures, significantly reducing report generation time.
  + Built responsive and user-friendly frontend modules with AngularJS, ensuring smooth interaction and real-time updates.
  + Ensured high system stability by applying clean architecture principles and performance tuning.
- **E-commerce Integration:** Built a middleware service from scratch to integrate Tik Tok platform APIs and synchronize data with the ERP system.
  + Designed the solution based on a Three-Layer Architecture (Presentation, Business Logic, Data Access) to ensure extensibility and scalability.
  + Implemented a bi-directional API integration with Tik Tok, leveraging webhook support for real-time synchronization of orders, inventory, and customer data.
  + Developed a Facebook Ads data pipeline to extract, transform, and load campaign performance metrics into the ERP system.

PROJECT

Base Structure (Backend Template) -

Link git: https://github.com/NTDno1/BaseProject

- **Tech Stack:**
  + Core, Data: .NET 9, C# 13, ASP.NET Core, EF Core, PostgreSQL.
  + Patterns: Clean Architecture, CQRS.
  + Utilities: FluentValidation, AutoMapper, Serilog.
- **Description:** This is a robust e-commerce platform built with .NET 9, utilizing ASP.NET Core, Entity Framework Core, and MediatR. It follows Clean Architecture and CQRS design patterns for scalability and maintainability. Key features include secure user authentication with JWT, comprehensive product management, and robust validation with FluentValidation. The project use PostgreSQL for data storage, integrates extensive logging and error handling, and supports unit and integration testing for reliability. It is designed to handle high-traffic environments with a strong focus on security and performance optimization.

Education Management System -

Link git: https://gitlab.com/NTDno1/sep490_g22

- **Tech Stack :** .NET, ReactJS, SQL, JWT Token
- **Description:** This project is developed with a back-end using C# based on a 3-layer architecture. It integrates JWT Token for authentication, FluentValidation for input data validation, Entity Framework for data retrieval, AutoMapper for data standardization and mapping, and SQL Server as the database management system.
  On the front-end, the project utilizes React.js to fetch data from the API and provides an interactive, flexible user interface.
